

I have a company in Melbourne where we make spray booths and ovens. We bought the SMART Plasma machine six months ago out of a trade show in Sydney. It was an easy to follow the instructions and it took approximately one day to set-up the machine and get it level. What we mainly use the SMART plasma for is to cut parts up to 6mm thick mild steel. Software support has been fairly simple. We did two days on-site training with ART staff. Basically, it's a simple machine to use, fast to program, and economical to run which is important.
